

What is claimed is:

1. In a controller of a computing device that comprises a system memory and a codec, a method comprising
reading data from a buffer of the system memory via a first interface of the controller,
transferring the data to the codec via a second interface of the controller,
tracking a position in the buffer from which the controller has read the data, and
writing a value to the system memory via the first interface to indicate the position in the buffer.
2. The method of claim 1 wherein reading comprises isochronously receiving the data via the first interface.
3. The method of claim 1 further comprising tracking progress of transferring the data to the codec via the second interface.
4. The method of claim 1 wherein reading the data from the buffer comprises reading the data per a buffer descriptor list that defines the buffer.
5. The method of claim 4. wherein reading the data from the buffer further comprises returning to a start of the buffer in response to reaching an end of the buffer.
6. The method of claim 1 further comprises determining to update the value in the system memory based upon the data transferred via the second interface prior to writing the value to system memory.

7. In a controller of a computing device that comprises a system memory and a codec, a method comprising

receiving data from the codec via a first interface of the controller,

writing the data to a buffer of the system memory via a second interface of the controller,

tracking a position in the buffer to which the controller has written the data,

and

writing a value to the system memory via the second interface to indicate the position in the buffer.

8. The method of claim 7 wherein writing the data to the buffer comprises isochronously transferring the data toward the buffer via the second interface.

9. The method of claim 7 further comprising tracking progress of receiving the data from the codec via the first interface.

10. The method of claim 7 wherein writing the data to the buffer comprises writing the data per a buffer descriptor list that defines the buffer.

11. The method of claim 10. wherein writing the data to the buffer further comprises returning to a start of the buffer in response to reaching an end of the buffer.

12. The method of claim 7 further comprises determining, prior to writing the value to system memory, to update the value in the system memory based upon the data received via the first interface.

13. A system comprising

a processor,

a system memory comprising a buffer and a buffer position,
an audio controller coupled to the system memory via a first bus, and
a codec coupled the audio controller via a second bus, wherein
the audio controller transfers data between the buffer and the codec via
the first bus and the second bus and updates the buffer position via the first bus
to indicate a position in the buffer associated with the audio controller transferring
between the buffer and the audio controller.

14. The system of claim 13 wherein the audio controller transfers the data
across the first bus via an isochronous channel and updates the buffer position
via the isochronous channel.

15. The system of claim 13 wherein the audio controller transfers the data
across a link of the first bus and updates a link position counter of the audio
controller based upon the data transferred across the link.

16. The system of claim 13 wherein the system memory further comprises
a buffer descriptor list that defines the buffer and the audio controller transfers
the data based upon the buffer descriptor list.

17. The system of claim 13 wherein the audio controller isochronously
reads the data from the buffer via the first bus and transfers the data to the codec
via the second bus.

18. The system of claim 13 wherein the audio controller receives the data
from the codec via the second bus and isochronously writes the data to the buffer
via the first bus.

19. A controller comprising

a first direct memory access controller to transfer data between a system memory and a codec via a first interface to the system memory and a second interface to the codec, and

a position in buffer controller to update a position value in the system memory via the first interface to indicate a position of the direct memory access controller in the buffer.

20. The controller of claim 19 further comprising a second direct memory access controller

to read from the system memory a buffer descriptor list that defines a buffer in the system memory, and

to configure the first direct memory access controller to transfer the data between the buffer and the codec per the buffer descriptor list.

21. The controller of claim 19 further comprising a link counter to maintain a count indicating progress of the first direct memory access controller in transferring the data across the second interface.

22. The controller of claim 19 further comprising a buffer position counter to maintain a count indicating progress of the first direct memory access controller in transferring the data across the first interface.

23. The controller of claim 19 wherein the first direct memory access controller isochronously writes the data to the buffer.

24. The controller of claim 19 wherein the first direct memory access controller isochronously reads the data from the buffer.

25. A machine-readable medium comprising a plurality of instructions that in response to being executed result in a computing device

configuring an audio controller to stream data between a buffer in a system memory of the computing device and a codec of the computing device,

configuring the audio controller to update a buffer position in the system memory based upon progress of transferring data between the buffer and the codec, and

reading the buffer position from the system memory to determine progress of the audio controller in streaming the data between the buffer and the audio controller.

26. The machine-readable medium of claim 25 wherein the plurality of instructions in response to being executed further result in the computing device

reading a link position from the audio controller to determine progress of the audio controller in streaming the data between the codec and the audio controller.

27. The machine-readable medium of claim 25 wherein the plurality of instructions in response to being executed further result in the computing device

allocating the buffer in the system memory and storing a buffer descriptor list in the system memory, and

configuring the audio controller to transfer the data per the buffer descriptor list.

28. The machine-readable medium of claim 25 wherein the plurality of instructions in response to being executed further result in the computing device

allocating a position in buffer structure in the system memory, and
configuring to update the position in buffer structure with the buffer
position.
